## 2016 Annual Rainfall Report

## Monitoring and Modeling

Saskatoon Water
Transportation \& Utilities Department

City of
Saskatoon

## EXECUTIVE SUMMARY

The following report provides a summary of Saskatoon's 2016 rainfall season (April to September) and a comparison with historical rainfall. Highlights of the report include the following:

- In 2016, 283 mm of rainfall accumulated, which was slightly more than the historical average of 265 mm .
- Rainfall occurred on $49 \%$ of days in 2016 with 24 mm being the largest amount of rainfall to accumulate in a single day.
- Saskatoon had a moderately dry spring in 2016 with 106 mm of accumulated rainfall between April and June. This is the $47^{\text {th }}$ lowest spring rainfall since 1900.
- Saskatoon had a wet summer in 2016 with 177 mm of accumulated rainfall between July and September. This is the $24^{\text {th }}$ highest summer rainfall since 1900.
- 2016 had an average of one rain event with a return period of two years or greater.

## INTRODUCTION

The purpose of this report is to provide a summary of the 2016 rainfall season in Saskatoon and a comparison of this rainfall data with historical rainfall data. Within the scope of this report, a rainfall season is defined as the time period between April $1^{\text {st }}$ and September $30^{\text {th }}$. Data between 1900 and 2011 was obtained from the Environment Canada rain gauge while 2012 to 2016 data was obtained from the eight City of Saskatoon rain gauges. The name, location, approximate area, and total seasonal rainfall of the aforementioned rain gauges are shown below.

Figure 1: Overview of Rain Gauges.

## SUMMARY OF RAINFALL IN 2016

A daily weighted average for all City of Saskatoon rain gauges functioning on a particular day was calculated to determine the average daily rainfall for Saskatoon. The following graph depicts the average daily rainfall that occurred in Saskatoon throughout the 2016 rainfall season.

Figure 2: 2016 Daily Rainfall.
The largest amount of rainfall occurred on August $3^{\text {rd }}, 2016$ with a total of 24 mm of rainfall. This rainfall accounted for approximately $8 \%$ of the total rainfall that occurred in 2016. It can also be observed from Figure 2 that rainfall occurred on approximately 49\% of days throughout the 2016 rainfall season.

## SUMMARY OF RAINFALL IN 2015

The total seasonal rainfall for 2016 was 283 mm. Figure 3 depicts the accumulation of rainfall throughout the 2016 season.

Figure 3: 2016 Rainfall Accumulation.
The 2016 rainfall season experienced a moderately dry spring, with the months of April to June accumulating a total of 106 mm of rain, which is the $47^{\text {th }}$ lowest spring rainfall since 1900. This rainfall accounted for approximately $37 \%$ of the total rainfall that occurred throughout the season. The remaining $63 \%$ of the total rainfall occurred between July and September, accumulating a total of 177 mm of rain. This is the $24^{\text {th }}$ highest summer rainfall since 1900.

## HISTORICAL COMPARISON

The average seasonal rainfall from 1900 to 2016 in Saskatoon is 265 mm which is depicted by the light blue line in Figure 4. The 2016 seasonal rainfall of 283 mm was slightly above average and is the $39^{\text {th }}$ greatest seasonal rainfall of the 116 years of data. The greatest seasonal rainfall occurred in 2010 with 569 mm , which is more than double the average seasonal rainfall. A table containing the seasonal rainfalls from 1900 to 2016 can be found in Appendix A.

Figure 4: Seasonal Rainfall (1900-2016).

## HISTORICAL COMPARISON

The following graph provides a comparison of the maximum amount of rainfall to occur in a single day in each season. The average rainfall in a single day in a season is 37 mm from the years 1900 to 2016 and is represented by the light blue line in Figure 5. During the 2016 rainfall season, the maximum rainfall to occur within a single day was 24 mm , which occurred on August $3^{\text {rd }}$. This is the $25^{\text {th }}$ lowest rainfall to occur in a single day out of the 116 years of data.

Figure 5: Maximum Daily Rainfall.
As can be seen in the graph above, the greatest maximum daily rainfall occurred on June $24^{\text {th }}, 1983$, with a total of 97 mm of rain. As well, only two of the last five years have had daily rainfalls which exceed the historical average.

## CLASSIFYING RAIN EVENTS

Rain events in Saskatoon are often localized. Therefore, a rain event may only occur at a few of the eight rain gauges located throughout the city. In order to compare the severity of rain events, their return period must be determined. A return period provides an indication of the likelihood of an event. For example, a rain event with a return period of 2 years has a $50 \%$ chance of occurring in any given year. For comparison, a rain event with a return period of 100 years has a $1 \%$ chance of occurring in any given year. The following table provides a summary of the criteria used to determine the return period of each rain event.

Table 1: Criteria for Determining Return Period of Rain Event.

| Time <br> (minutes) | Intensity (mm/hr) |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 2-Year | 5-Year | 25-Year | 100-Year |
| 10 | 53 | 85 | 132 | 168 |
| 15 | 41 | 67 | 104 | 133 |
| 30 | 26.4 | 46.1 | 74 | 97 |
| 60 | 16.6 | 28.9 | 46.5 | 60 |
| 120 | 10.7 | 17.5 | 27.3 | 35 |
| 360 | 4.7 | 7.0 | 10.3 | 12.9 |
| 720 | 2.73 | 3.90 | 5.59 | 6.91 |
| 1440 | 1.56 | 2.18 | 3.07 | 3.76 |

For the purposes of this report, two different methods were utilized to determine the number of rain events with a return period of $2,5,25$, or 100 years between 2012 and 2016. It should be noted that within this report, rain events with the same return period may include any of the durations as outlined in Table 1. The first method determined the average number of rain events for each return period by adding together the number of events in a season with the same return period at each of the city's rain gauges and dividing that number by eight. The following table provides a summary of these values. A more detailed table can be found in Appendix C.

Table 2: Average Frequency of Rain Events.

|  | Return Period | $\mathbf{2 0 1 2}$ | $\mathbf{2 0 1 3}$ | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 1 5}$ | $\mathbf{2 0 1 6}$ | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Average | $2-5$ Year | 4 | 1 | 3 | 1 | 1 | 10 |
|  | $5-25$ Year | 0 | 0 | 0 | 1 | 0 | 1 |
|  | 0 | 0 | 0 | 0 | 0 | 0 |  |
|  | $>100$ Years | 0 | 0 | 0 | 0 | 0 | 0 |
| Total | $\mathbf{4}$ | $\mathbf{1}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{1 1}$ |  |

## CLASSIFYING RAIN EVENTS

The second method determined the overall number of rain events for each return period by counting the number of rain events that occurred at one or more of the rain gauges on any given day within a season. If the rain gauges had varying return periods on a given day, the maximum return period was counted as the rain event for that day. The following table provides a summary of these values.

Table 3: Overall Frequency of Rain Events.

|  | Return Period | $\mathbf{2 0 1 2}$ | $\mathbf{2 0 1 3}$ | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 1 5}$ | $\mathbf{2 0 1 6}$ | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Overall | $2-5$ Year | 8 | 5 | 6 | 3 | 3 | 25 |
|  | $5-25$ Year | 0 | 1 | 1 | 0 | 0 | 2 |
|  | $25-100$ Year | 0 | 0 | 0 | 1 | 0 | 1 |
|  | $>100$ Years | 0 | 0 | 0 | 0 | 0 | 0 |
|  | Total | $\mathbf{8}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2 8}$ |

## CONCLUSION

Overall, the 2016 rainfall season had an accumulation which was marginally greater than the historical seasonal average. Although the 2016 rainfall season had a moderately dry spring, the summer was wet with $63 \%$ of the seasonal rainfall occurring between the months of July and September. During these three months, two rain events occurred with a return period of two years or greater occurred throughout Saskatoon. The largest rain event occurred on August $8^{\text {th }}$ and was determined to be a two year return period event. However, this event was only experienced at two of the City's eight rain gauges. The remaining six rain gauges experienced a rain event with a smaller average intensity resulting in an event with a return period which was less than two years.
