## EXECUTIVE SUMMARY

The following report provides a summary of Saskatoon's 2019 rainfall season (April to September) and a comparison with historical rainfall. Highlights of the report include the following:

- In 2019, 258 mm of rainfall accumulated, which was slightly less than the historical average of 264 mm .
- On average, rainfall occurred on $35 \%$ of days in 2019.
- Based on the weighted average, 37 mm was the largest amount of rainfall to accumulate in a single day.
- Saskatoon had a moderately dry spring in 2019. The average rainfall between April and June since 1900 is 127 mm . Saskatoon received 103 mm which falls in the $39^{\text {th }}$ percentile for this time period.
- Saskatoon had a moderately wet summer in 2019. The average rainfall between July and September since 1900 is 137 mm . Saskatoon received 155 mm which falls in the $64^{\text {th }}$ percentile for this time period.
- 2019 had an average of three rain events with a return period of two years or greater.
- A 5-25 year rain event occurred in the morning of July $14^{\text {th }}, 2019$ and a 2-5 year rain event occurred in the evening of the same day.

## INTRODUCTION

The purpose of this report is to provide a summary of the 2019 rainfall season in Saskatoon and a comparison of this rainfall data with historical rainfall data. Within the scope of this report, a rainfall season is defined as the time period between April $1^{\text {st }}$ and September $30^{\text {th }}$. Data between 1900 and 2011 was obtained from the Environment Canada rain gauge while 2012 to 2016 data was obtained from eight City of Saskatoon rain gauges. In 2017, one of the City of Saskatoon rain gauges was decommissioned and therefore seven rain gauges remain. The name, location, approximate area, and total seasonal rainfall of each rain gauge is shown below.

## SUMMARY OF RAINFALL IN 2019

A daily weighted average for all City of Saskatoon rain gauges functioning on a particular day was calculated to determine the average daily rainfall for Saskatoon. The following graph depicts the average daily rainfall that occurred in Saskatoon throughout the 2019 rainfall season.

Figure 2: 2019 daily rainfall.
Based on the weighted average, the largest amount of rainfall occurred on June 22 ${ }^{\text {nd }}, 2019$ with a total of 37 mm . This rainfall accounted for approximately $14 \%$ of the total rainfall that occurred in 2019.

Table 1 presents the percentage of days with total rainfall greater than or equal to 0.2 mm , $1 \mathrm{~mm}, 5 \mathrm{~mm}, 10 \mathrm{~mm}$, and 25 mm at each rain gauge.

## SUMMARY OF RAINFALL IN 2019

The total seasonal rainfall for 2019 was 258 mm . Figure 3 depicts the accumulation of rainfall throughout the 2019 season.

Figure 3: 2019 rainfall accumulation.
The 2019 rainfall season experienced a moderately dry spring, with the months of April to June accumulating a total of 103 mm of rain, which is the $47^{\text {th }}$ lowest spring rainfall out of 120 years since 1900 . This rainfall accounted for approximately $40 \%$ of the total rainfall that occurred throughout the season. The remaining $60 \%$ of the total rainfall occurred between July and September, accumulating a total of 155 mm of rain. This is the $42^{\text {nd }}$ highest summer rainfall out of 120 years since 1900 .

## HISTORICAL COMPARISON

The average seasonal rainfall from 1900 to 2019 in Saskatoon is 264 mm which is depicted by the light blue line in Figure 4. The 2019 seasonal rainfall of 258 mm was slightly below average. The lowest seasonal rainfall occurred in 2001 with 131 mm and the highest seasonal rainfall occurred in 2010 with 569 mm . A table containing the seasonal rainfalls from 1900 to 2019 can be found in Appendix A.

Figure 4: Seasonal rainfall (1900-2019).

## HISTORICAL COMPARISON

The following graph provides a comparison of the maximum amount of rainfall to occur in a single day in each season. The average maximum rainfall in a single day in a season is 36 mm from the years 1900 to 2019 and is represented by the light blue line in Figure 5. During the 2019 rainfall season, the maximum rainfall to occur within a single day was 37 mm , which occurred on June $22^{\text {nd }}$. This is the $45^{\text {th }}$ highest rainfall to occur in a single day out of the 120 years of data.

Figure 5: Maximum daily rainfall.
As can be seen in the graph above, the lowest maximum daily rainfall occurred on July $19^{\text {th }}$, 1987, with a total of 15 mm and the highest occurred on June $24^{\text {th }}, 1983$ with a total of 97 mm.

## CLASSIFYING RAIN EVENTS

Rain events in Saskatoon are often localized. Therefore, a rain event may only occur at a few of the seven rain gauges located throughout the city. In order to compare the severity of rain events, their return period must be determined. A return period provides an indication of the likelihood of an event. For example, a rain event with a return period of 2 years has a $50 \%$ chance of occurring in any given year. For comparison, a rain event with a return period of 100 years has a $1 \%$ chance of occurring in any given year. The following table provides a summary of the criteria used to determine the return period of each rain event.

Table 2: Criteria for determining return period of a rain event.

| Time <br> (minutes) | Intensity (mm/hr) |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 2-Year | $\mathbf{5 - Y e a r}$ | $\mathbf{2 5 - Y e a r}$ | $\mathbf{1 0 0 - Y e a r}$ |
| 10 | 53 | 85 | 132 | 168 |
| 15 | 41 | 67 | 104 | 133 |
| 30 | 26.4 | 46.1 | 74 | 97 |
| 60 | 16.6 | 28.9 | 46.5 | 60 |
| 120 | 10.7 | 17.5 | 27.3 | 35 |
| 360 | 4.7 | 7.0 | 10.3 | 12.9 |
| 720 | 2.73 | 3.90 | 5.59 | 6.91 |
| 1440 | 1.56 | 2.18 | 3.07 | 3.76 |

For the purposes of this report, two different methods were utilized to determine the number of rain events with a return period of $2,5,25$, or 100 years between 2012 and 2019. It should be noted that within this report, rain events with the same return period may include any of the durations as outlined in Table 2. The first method determined the average number of rain events for each return period by adding together the number of events in a season with the same return period at each of the city's rain gauges and dividing that number by the total number of rain gauges (seven). The following table provides a summary of these values. A more detailed table can be found in Appendix B.

Table 3: Average frequency of rain events.

## CLASSIFYING RAIN EVENTS

In Table 4, the rain events were tallied using the same method as Table 3, except only rain events with a duration of 1 hour or greater were counted.

Table 4: Average frequency of rain events greater than or equal to 1 hour duration.

|  | Return Period | $\mathbf{2 0 1 2}$ | $\mathbf{2 0 1 3}$ | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 1 5}$ | $\mathbf{2 0 1 6}$ | $\mathbf{2 0 1 7}$ | $\mathbf{2 0 1 8}$ | $\mathbf{2 0 1 9}$ | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Average | $2-5$ Year | 3 | 1 | 2 | 1 | 0 | 1 | 0 | 1 | 9 |
|  | $5-25$ Year | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
|  | $25-100$ Year | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
|  | $>100$ Years | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Total | $\mathbf{3}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{2}$ | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{0}$ | $\mathbf{0}$ | $\mathbf{1 0}$ |  |

The second method determined the number of days per year that a major rain event occurred at one or more rain gauges. If the rain gauges throughout the City recorded varying return periods on a given day, the maximum return period was counted as the rain event for that day. The following table provides the number of days per year that a major rain event occurred at one or more rain gauges.

Table 5: Overall frequency of rain events.

|  | Return Period | $\mathbf{2 0 1 2}$ | $\mathbf{2 0 1 3}$ | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 1 5}$ | $\mathbf{2 0 1 6}$ | $\mathbf{2 0 1 7}$ | $\mathbf{2 0 1 8}$ | $\mathbf{2 0 1 9}$ | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

In Table 6, the days per year were tallied using the same method as Table 5, except only days with a rain event of 1 hour duration or greater were counted.

## CONCLUSION

Overall, the 2019 rainfall season had an accumulation which was slightly less than the historical seasonal average. Despite the lower than average seasonal rainfall, 5 rain events occurred with a return period of 2-5 years and 2 rain events occurred with a return period of $5-25$ years. Based on a weighted average, the maximum rainfall to occur within a single day was 37 mm , which occurred on June 22nd.
