

This electronic meter has three separate display registers. Each register will display information for approximately six seconds. The first register is a segment test register to show that all meter segments are working. The second register shows the power delivered to your home and displays the current reading in kilowatt hour consumption. The third register is designed to show power given back to Saskatoon Light & Power by our customers. This register is intended for use in the future if a home-owner produces surplus power through solar or wind generation and contributes power back to the electric grid.

The test register displays eights in this formation: **888.88.8**. This sequence shows that the meter is working correctly.

The second register shows the current reading of your meter. Please record all six digits when entering a meter reading online or on a self-read card. Submit your meter read online at [www.saskatoon.ca](http://www.saskatoon.ca) or by phone: (306) 975 2400 or 1 800 667 9944.

The third register is designed to display power given back to the electric grid. Unless your home is producing electricity, this register will display a minus sign and five zeros: **-00000**
