

BRT SUMMARY

The City of Saskatoon Growth Plan identified Bus Rapid Transit (BRT) as a key strategy to shape the future of Saskatoon. The Red, Green and Blue BRT will:

- Be major organizing elements of the Growth Plan
- Form the structural backbone of Saskatoon Transit
- Support a mode shift to transit
- Support land use intensification along major corridors
- Anchor the Transit Villages developments

This document summarizes the BRT plan approved by City of Saskatoon Council on April 29, 2019. The BRT elements summarized in this document build on the work done for the Preferred Configuration Report (2017), feedback received during public and stakeholder engagement in 2018 and 2019, and previously submitted technical memos.

The BRT plan sets the stage for detailed design and implementation plan. The summary revolves around five foundational BRT elements:

- Runningways
- Stations
- Transit Signal Priority
- Geometric Measures
- Customer Systems

Route Overview

The BRT system will connect the city from east to west and north to south, along major corridors:

The **Red Line** operates between the Blairmore Suburban Centre and the Briarwood neighbourhood via 22nd Street, 1st Avenue, University Bridge, College Drive, Preston Avenue S, and 8th Street W.

The **Green Line** operates between Confederation Mall and University Heights Square via 22nd Street, 1st Avenue, University Bridge, College Drive, Preston Avenue N, and Attridge Drive.

The **Blue Line** operates between the Lawson Heights Suburban Centre and the Stonebridge neighbourhood via Primrose Drive, Warman Road, 33rd Street, Idylwyld Drive, 1st Avenue, Broadway Bridge, Nutana, 8th Street W, and Preston Drive S.

| BRT Element | Scale | Quick Facts |
|--------------------------------|--------------------------------|---|
| Runningways | Mixed Traffic Exclusive Lanes | <ul style="list-style-type: none"> • BRT route 38km • Mixed traffic operations 35.3km • Exclusive runningways (transit-only lanes) 2.7km |
| Customer Systems | Few All | <ul style="list-style-type: none"> • Identification pylon • Real-time information display • Shelter & on-call radiant heater • CCTV camera • Advertising display • Public art opportunities |
| Stations | Modest Signature | <ul style="list-style-type: none"> • 85 station platforms • Highly functional and scalable platform and shelter • Unique, bright, visible, and clean shelter design |
| Geometric Measures | Few Many | <ul style="list-style-type: none"> • Six bus-only queue jump locations |
| Transit Signal Priority | None All | <ul style="list-style-type: none"> • 38km fibre optic communication duct • 114 upgraded traffic signal controllers • 90 intersections with transit signal priority (TSP) |

0 0.5 1 2 Km

Map of the proposed Rapid Transit System for the City of Regina, Saskatchewan. The map shows three main lines: Red Line, Green Line, and Blue Line. The Red Line runs from Betts to Boychuk. The Green Line runs from Diefenbaker to University Heights. The Blue Line runs from Hunter to Lawson Heights. The map also shows various stations, queue jump lanes, and transit villages. A legend in the top left corner explains the symbols used. A scale bar in the bottom left corner indicates distances up to 2 km. A north arrow is in the top right corner.

RUNNINGWAYS

Of the 38km of BRT, 35.3km will run in mixed traffic and 2.7km will have exclusive runningways (transit-only lanes) along 1st Avenue Downtown and College Drive. Exclusive runningways will improve BRT travel times and reliability. For both of these corridors a centre-running contraflow configuration has been approved.

Along Broadway Avenue, a mixed traffic operation with bump-out stations has been approved. Bump-out stations reduces bus travel time by removing the need to pull in and out of the parking lane.

Section of College Drive Contraflow Runningway

STATIONS

Platforms

The BRT system will have 85 station platforms:

- Generally, station platforms will be located farside of the intersection which allows the bus to stop after the signal and take advantage of transit signal priority, eliminates bus blockage of right turn lanes and encourages pedestrians to cross behind the bus.
- For most locations, the recommended platform dimensions are 36m x 4m which will comfortably accommodate 12 to 20 waiting passengers, shelter, station furniture, customer systems, and three regular buses or two articulated buses.

Shelter Design

The shelter is one of the most prominent features of the BRT system which will differentiate the BRT service from local routes, enhance the customer experience, and contribute to placemaking efforts.

- The design is based on stakeholder feedback for a well-lit, easily maintained, and highly visible structure.
- The warm, bright, sleek and simple design language along with the neutral colours allows the shelter to be a blank canvas onto which theming elements or public art can be applied.

TRANSIT SIGNAL PRIORITY

Transit signal priority (TSP) measures help to move buses through intersections, reducing bus travel time and increasing schedule reliability:

- Fibre optic duct communication will provide for the coordination of 114 upgraded traffic signal controllers.
- 90 intersections will be upgraded to include TSP.

CUSTOMER SYSTEMS

Customer systems improve the passenger experience, safety and comfort and are focused at stations. In addition to the shelter, customer systems can contribute to the streetscape and placemaking efforts:

- **Pylon:** provides a strong visual station identification and houses communications and electrical panels
- **Real Time Information Display:** present bus arrival times and public announcements
- **On-Call Radiant Heaters:** mounted in the ceiling of each shelter. The heater is activated by a push-button.
- **Lighting:** illuminates the interior and exterior of the shelter. Ambient light from the station shelter and surrounding street lights will illuminate the platform.
- **CCTV Camera:** captures video of the platform and shelter area at regular intervals.
- **Advertising Display Unit:** installed at the approach end of the platform and can be backlit or digital.
- **Public Art:** incorporated at some or all of the station platforms and can be achieved in multiple ways and could be incorporated in the advertising display, as functional station furniture, as an application on the shelter glass, or along the platform.

GEOMETRIC MEASURES

Congestion in Saskatoon is mainly located at intersections. In addition to TSP, there are six critical locations where bus only queue jump lanes will allow the BRT to bypass congestion.
