Major Projects Asset Preservation  
December 10, 2015

# 2016-2018 Projected Roadway Preservation

## Roadway Preservation Asset Management

Roadway Asset Management is a process of monitoring, maintaining, and preserving our roads effectively throughout their lifecycle. Our goal is to employ effective decision making to optimize a cost effective mix of treatments, to maximize the number of road treated to improve the roadway network as a whole.

### Assumptions

The following assumptions were used to produce this preliminary roadway preservation document:

- For 2016 Target funding is achieved, although it is a combination of one-time funding and base funding.
- Target base funding, if approved, should be reached in 2017 and maintained for 2018.
- Treatment quantities developed are based on adjusted previous year close out reports. Treatment quantities and locations may vary once contract pricing is received or after construction is initiated.
- The unit rate cost estimates are based on but not limited to: contractor unit rates, project management, administration, traffic control, miscellaneous surface prep work, testing, and a contingency.
- The attached document includes proposed treatments. Actual locations and quantities treated may vary prior to construction.
- A lane-km, as referred to in this document, is the calculation of the current paved area divided by a lane width of 3.8 metres and then divided by 1000 metres per kilometre which results the Lane-km.
- Sidewalk preservation of severely damaged sidewalk panels and safety maintenance of lightly damaged sidewalk panels will be performed adjacent to the treated roadways.

## Treatment Descriptions

**Crack Sealing** – Crack sealing is a rubberized asphaltic material that is used to seal transverse and longitudinal cracks, open longitudinal seams, and minor fatigue cracking. Crack sealing prevents moisture infiltration into the roadway structure to reduce the chance of premature structural failure and potholes.

**Typical Crack Filling Project**

**Microsurfacing** - Microsurfacing is a surfacing treatment involving the placement of specified crushed graded aggregate with an asphalt emulsion. This treatment is placed on roads that are structurally sound, with limited or no cracking, and with no significant surface imperfections. This treatment is typically used to address roadways with weathered or ravelled surfaces.

**Typical Microsurfacing**

**Blade Level** – Blade levelling is placing a layer of hot mix asphalt with a motor grader and then compacted with steel and rubber tire rollers for entire road segment. Blade levelling is currently performed by City Public Works crews. Its primary purpose is to improve the roadway surface profile, which results in improved drainage and ride.

**Typical Blade Level Project**

**Structural Overlays** – A structural overlay is an overlay to provide additional structure to the existing roadway to accommodate current and future traffic loads. Structural overlays are intended to have a thickness of no less than 40mm. Additional design based on AASHTO 93 principles may be required to assess whether the roadway needs greater than 40mm. This treatment it is used on roads identified through condition assessment that have a rural cross section or sufficient curb height present to accommodate additional thickness of asphalt.

**Typical Overlay Project**

**Ultra Thin Overlays** – The Ultra Thin Overlay (UTO) is a heavier and smoother wearing course than that of microsurfacing. It utilizes a fine graded aggregate combined with a polymer modified asphalt bitumen. UTOs are typically placed in a thickness ranging from 25-35mm to provide a little extra structure but more so act as a higher quality wearing surface and improve ride quality. This treatment may require spot milling where existing asphalt is fatigue cracked and will not provide sound foundation for the UTO. Typically it is used on roads with minor surface imperfections and signs of raveling or weathering.

**Typical Ultra Thin Overlay Project**

**Resurfacing** – Resurfacing uses a milling machine to remove a layer of existing deteriorated pavement surface as well as to restore the roadway profile prior to adding a new asphalt layer. This treatment replaces the surface and restores the road profile.

**Typical Resurfacing Project**

**Reconstruction** – Reconstruction is used when the entire section of roadway has structurally failed or the asphalt pavement has deteriorated and is unable to support its intended loads. Reconstruction involves the complete removal and replacement of the asphalt, base and sub base and may involve the removal and/or strengthening of a portion of the sub grade of the entire roadway section. When ground water is a factor in the full depth structural failure, a subdrain system is typically installed during the repair. There are two types of reconstruction currently being practiced; Conventional full depth reconstruction or Remove and Replace asphalt only with spot deep repairs as required.

**Typical Reconstruction Project**

**Water/Sewer Coordinated Road Works** – Water and Sewer Road Restoration is used to restore the roadway outside the limits of the water/sewer work. It is the responsibility of the water/sewer to restore the roadway within its work limits and be charged to the water/sewer budget. Outside of the water/sewer limit, the roadway budget will cover the costs.

**Typical Water/Sewer Coordinated Road Project**

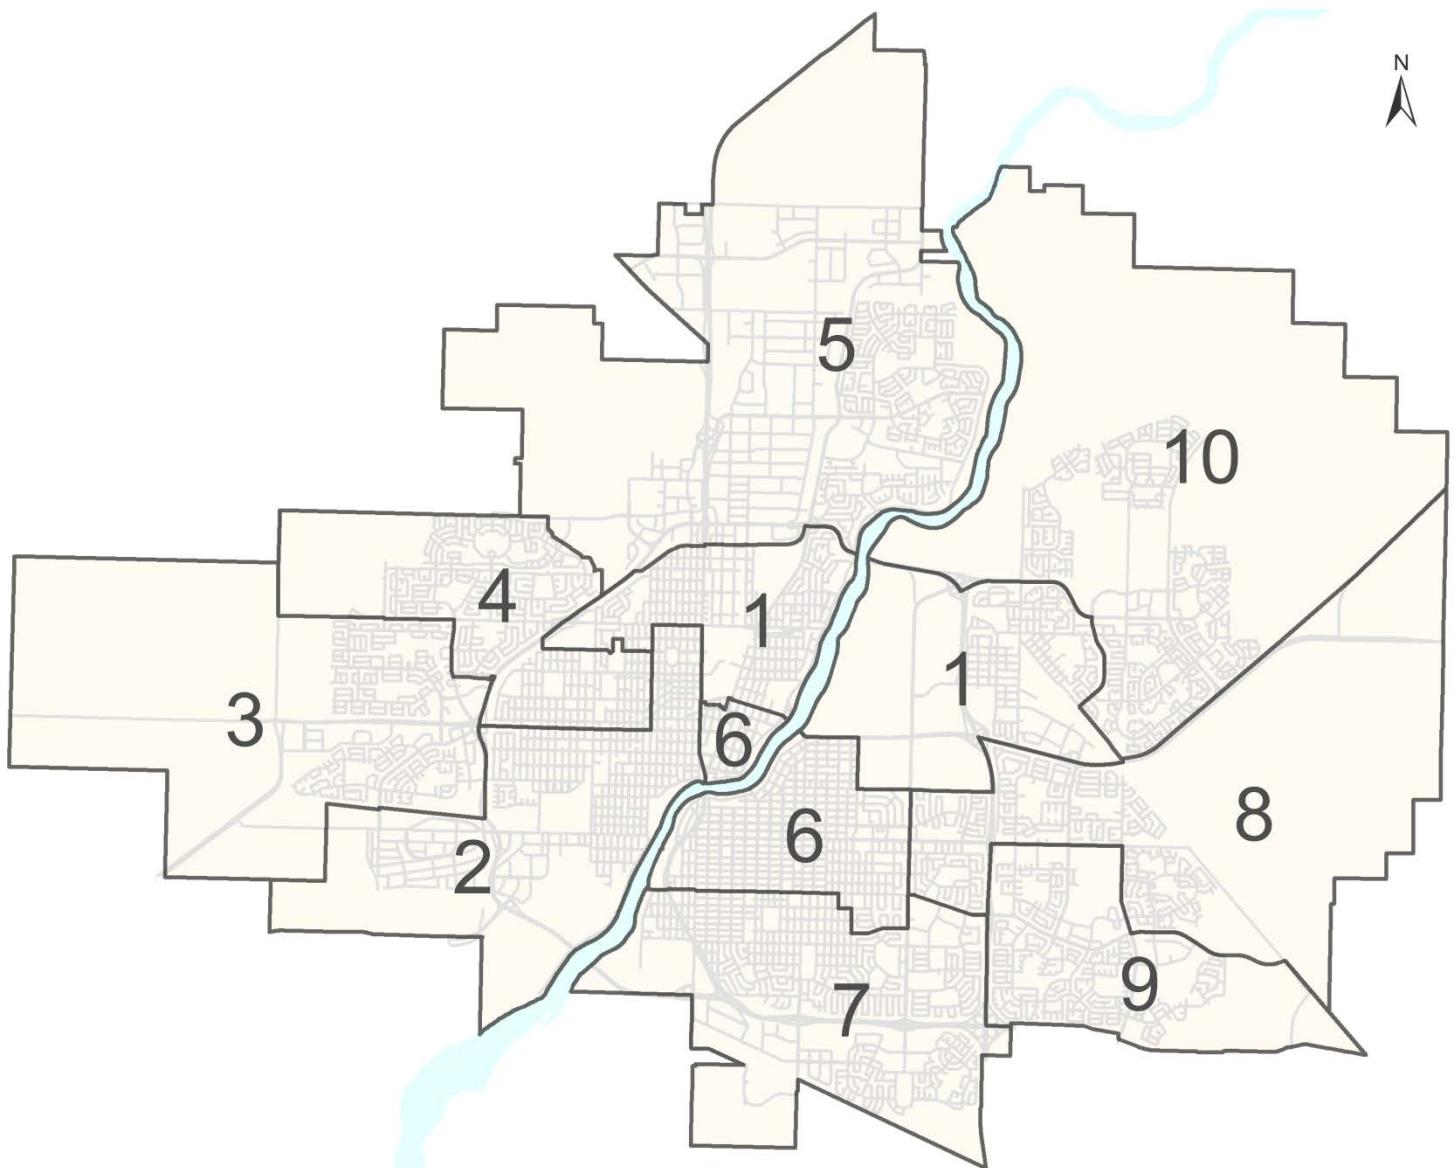

**Patching** – Patching is used when an isolated sections of the roadway has deteriorated asphalt, poor ride, poor drainage, or is structurally failed and is unable to support its intended loads. This can occur from premature weathering, raveling, settlements, traffic loading is greater than the road was designed to carry, rising water table weakening the subgrade, or poor construction control. Patching involves the restoring the localized failures on the roadway to a competent state by either surface patching to improve the ride and drainage, up to complete removal and replacement of the asphalt, and possibly base and subbase. Patching shall be used as required in conjunction with other treatments to improve the entire roadway segment.

**Typical Patching Project**
